

The targets are at distances from 10m up to 50m. Airgun pellets follow a curved trajectory as they leave the gun's muzzle, which means that it is necessary for the shooter to estimate the target's range and aim the rifle directly at, above, or below the target depending on its range in order to hit it. If wind is pushing the pellets to one side, the shooter must also aim left or right to compensate. Some targets may be located up trees, or be positioned uphill or downhill from the shooter. A Field Target competition course consists of 30 to 60 knock-down targets, arranged in separate lanes, each with several targets. You only get one shot per target before moving on to the next lane. It is usual to shoot from a sitting position, although some targets must be shot from a kneeling or standing position in order to add to the fun and challenge of the competition.
